A Gearbox is an internal mechanical device used to drive one or more shafts. The primary purpose of a gearbox is to change the speed of rotation of one shaft in order to provide a ratio for the subsequent shafts. The concept of gear ratio is a byproduct of gearbox technology. Gearboxes are used to

transfer power from a power supply to a mechanical device. power is transmitted using gears and shafts which results in an increase in the mechanical efficiency of the machine. gearboxes are used for the purpose of speed and force multiplication for smoother operation. Gearboxes are of two types with very different performance. When operated properly, gearboxes increase the mechanical efficiency of a machine and reduce maintenance costs. Gearboxes are a major component of any machinery powered by an internal combustion engine or motor. the purpose of a gearbox is to increase the torque and speed of rotation of the output shaft of the motor or engine. Stages are internal components of gearboxes which directly relate to the creation of gear ratio. The number of stages directly relates

to the maximum gear ratio that the gearbox will provide. each stage is composed of spur gears and internal mechanisms. These mechanisms include oil-lubricated gears, friction drive plates, bearings, shafts, pinions, and other internal components. the design of these components is geared to the type of gears used and the transmission ratio that is required for the gearbox. the components also comprise clutch shafts, bevel gears, and the power transmission shafts that are part of the transmission. When a shaft spins, the teeth on the bevel gears or the teeth on the pinions on the internal components move and mesh and transfer the power. the gears and shafts must be strong enough to withstand the high torque and speed that are applied. Gearboxes are used on engines to increase

the torque and speed of the output shaft. gearboxes are used in outboard, midget, motorcycle, and automobile engines. The components of gearboxes are designed to increase efficiency and reduce stress on the engine, transmission, and other components of a motor or engine. Step-down gearboxes are used to reduce the engine speed and increase the torque. this is useful for small engines which do not produce sufficient torque to drive the shaft. Same page step-down gearboxes make it possible to increase the torque and speed for a variety of engines. high-performance engines are built to produce more f30f4ceada
