Download this app to manage your other tablets like Nexus One, Samsung Galaxy Tab, Barnes and Noble Nook, ASUS, Acer, Lenovo. Still not find the tablet you are looking for? Then feel free to contact us to avail custom-built solution for your tablet - to meet your service requirements and needs.This invention relates to printing systems, and more specifically to a graphic communication system employing a multi-output dot matrix printer that is capable of producing any one of a variety of printed statements on a continuous basis. Modem microprocessor based personal computers have typically required the involvement of two people to effect the printing of a given document. One person has primarily utilized the computer and keyboard to prepare the electronic text for printing on a dot matrix printer, while the second person has been required to operate the dot matrix printer to physically transfer the text to a paper medium. The page to be printed is presented to the operator of the dot matrix printer, and the operator must then determine the order of the text, prepare the electronic text, and then employ the dot matrix printer to print the page of text on paper. The dot matrix printer is not readily programmed to print one page of text on each pass of the printing mechanism. For example, if the total print area of the page to be printed comprises thirty-six lines by twenty-four characters, a typical dot matrix printer must print pages having one thirty-six line page per pass of the printing mechanism. A given dot matrix printer may even require several

passes for the printing of a single page of text if the printing mechanism is capable of printing only one letter of text per pass. Various document printing systems have been developed to utilize the capabilities of dot matrix printers to produce a given document without requiring manual manipulation by the user of the printer. However, many document printing systems have required the employment of two people to operate the system. A typical system requires the operator to utilize a computer system and keyboard to prepare the electronic text of the document for printing, while a second person is required to operate the dot matrix printer to transfer the electronic text to a paper medium. Other document printing systems have required complicated computer programs to control the dot matrix printer to print the given document. Such systems typically required a user to have prior knowledge of the particular computer language required to program the dot matrix printer. However, these systems require the utilization of a relatively large number of paper sheets, and also required the use of a relatively large number of seconds of time to print a given document. In accordance with the present invention
