Answer : It's because it happens on the assumption that a certain property of the target image is preserved. In other words, it's like cheating. I'm not sure how this transformation can be achieved with a system such as Magick. However, in your case, the following approach is applicable. After uploading your test image to the server, you can get the details of "Uniqueness constraint" by using the following command, by referring to the Magick::annotate documentation. magick identify.../test.jpg If you find the uniqueness constraint of your test image as "t", I'd like to know the pair number of "d" in the subsequent line. You can get the pair number by using the following command. magick identify.../test.jpg 2>/dev/null | grep "^d:" You may find the pair number is "3d" in my case. (Yureka, which is a third-party program, can do the same calculation on the client side, too. d can be changed to i or s if you want to output the pair number in hexadecimal format.) 50? 800 What is the common

denominator of -67/6 and 49/47? 282 Find the common denominator of -25/7 and 39/34. 238 What is the least common multiple of 8 and 1020? 2040 Calculate the lowest common multiple of 600 and 125. 3000 Calculate the least common multiple of 4 and 780. 780 What is the least common multiple of 3698 and 4942? 34318 Calculate the common denominator of 35/7554 and -47/16. 60432 Calculate the lowest common multiple of 100 and 6200. 6200 Calculate the lowest common multiple of 2 and 23. 46 What is the least common multiple of 1707 and 826? 3414 Calculate the lowest common multiple of 70 and 70. 70 What is the smallest common multiple of 22 and 8? 88 Calculate the least common multiple of 45 and 5. 45 Calculate the lowest common multiple of 4 and 2490. 4980 Calculate the lowest common multiple of 2 and 36. 36 What is the least common multiple of 586 and 24?
