if you are a security researcher who is interested in cobalt strike's command and control abilities, you can read our white paper for more information about how these capabilities work, and how you can include similar capabilities into your own penetration testing platform. there are countless ways to deliver remote access exploits, ranging from email attachments and malicious websites, to usb sticks and even social engineering. with the increase in complexity around these attacks and tools, scripting is often a go-to deployment method. in this context, a cobalt strike beacon allows attackers to remotely execute arbitrary commands, allowing them to upload payloads, such as binary payloads. b. ulf hesselgren (formerly vadim grebennikov) worked at nss since 2016. during his tenure, he contributed the nessus plugin for cobalt strike, which was the first implementation of the cobalt strike beacon to the community. the nessus plugin provides an example of how existing nessus plugins can be extended to take advantage of cobalt strike's beacon feature. often, cyber criminals use this malware to steal credentials and other information. if a user clicks on one of the links of a malicious email, the two-step infection will start. in the first step, the malware will download a virus from the c&c server. then, it will start the second step by running the virus and launching cobalt strike. once the user inputs the correct information, a page will appear that requests the user's system info. this information is requested because the cobalt strike begins working on the user's device.once the information is gathered, the user is presented with a second alert. this time, the message reads, "you are now authorized to remote control your device". the user will be taken to the main cobalt strike menu.
